

The lights installed in left wing

Taxi/ Landing light option

The overhang of the top skin past the Channel is to shield the pilot from being blinded by the light bulbs!

Cutout is O/B of Nose Rib #7 (nose rib in line with rear rib #9).

WING ASSEMBLY 6-LLO-1 - Page 1 of 12

LANDING LIGHT CHANNEL 6-LLO-1-1 (qty=1)

LANDING LIGHT FILLER RIBLET 6-LL0-1-2 (qty=1)

4 RIVETS A4

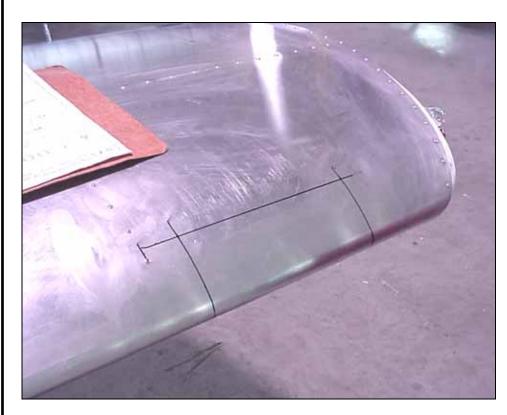

Clamp and drill

Ref drawing 6-LLO-1

The aft flange of the rib is bent in the same direction as the side flange. Install the O/B edge of the rear flange flush with the O/B edge of the Channel 6-LLO-1-1

Landing light reinforcement assembly

Measure and layout for the cutout in the leading edge skin for the landing lights. CHECK: Hold the channel and riblet assembly to the wing.

Ref. = Rivet line through spar (top & Bottom)

Note: The distance from spar to the edge of the cutout is longer on the top than on the bottom.

Layout the corner relief holes: Radius approximately ¼", edge of radius is tangent with the cutout.

LENS 6-LLO-1-6 FORMED ACRYLIC QTY=1

ZODIAC 601 XL

Revision 3.3 (05/19/06) © 2004 Zenith Aircraft Co. WING ASSEMBLY 6-LLO-1 - Page 3 of 12

CHECK: Lay the lens over the leading edge skin to check that the width of the cutout fits inside the lens.

Position the landing light reinforcement assembly against the side of Nose Rib #7, 4 RIVETS A4

First make a rough cut then a final cut, Note: photos does not show the 12mm radius in the corner. If you forget to layout the R12, then it is necessary to use a round file to finish the corner relief hole as shown in the photo and photo on page 11 and 12.

A4 PITCH 40 Skin to Channel.

NOTE: Rivet pitch in the Riblet 6-LLO-1-2 to the Leading Edge Skin 6W8-1, is similar to NR#7

Back Plate 6LLO1-3

6-LLO-1-3 Notch in back plate.

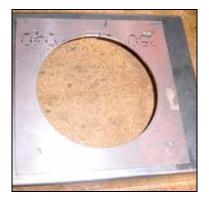

Face Plate. 6LLO1-4

Line up the hole in the plate over the flanged lightening hole in the channel.

Back drill the 3/16" through the channel 6LLO1-1

Insert a screw through the channel and screw on the nutplate.

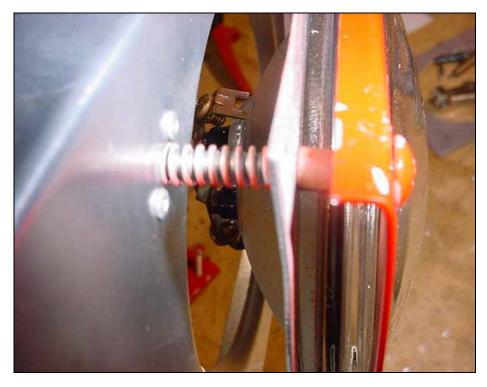

With A3 rivets, rivet the nuplate to the channel.

#20 drill bit. Back drill through the nutplate.

Detail of backside of channel.

In the kit there are two #14 wires. One for the landing light, and the other for the taxi light. Each are connected to a panel switch and grounded to the airframe.

Upon final assembly tape the backing strip 6-LLO-1-7 inside the lens, Secure the lens with sheet metal screws into the backing strip.

NOTE: The screws along the sides are not necessary with the formed acrylic lens. 4 screws along the back instead of 5

Lens overlaps on the inside of the skin (reversed overlap)

First slide the lens towards the inboard side then slide it over against the riblet.

Pull the lens forward to minimize the gap between the leading edge skin and the lens.

SUGGESTION: Bend a short flange at the end of the aluminum strip to form a "hook" to help pull the edge of the lens forward into the leading edge of the skin.

5 screws across the top into the backing strip 6LLO1-7

Outboard detail.

Note: In the installation shown in the above photo, the outboard edge of the lens is up against the riblet.

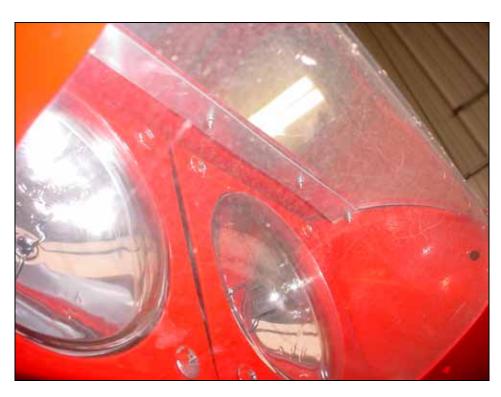

Inboard detail.

COMMENT: To get the lens inside the opening in the leading edge, it may be necessary to trim off the aft inboard corner (cut off a pie shaped wedge).
